Mean Annual Discharge and System Capacity for Chinook Salmon

Species Information

Common Name: Chinook Salmon
Genus: Oncorhynchus tshawytscha

Stressor Details

Stressor Name: Flow; Discharge
Units: %
Metric: Mean annual discharge
Scale: linear
Function Type: continuous
Vital Rate/Process: Total number of spawners

Life Stage & Context

Life Stages: Adults
Geography: Nicola River, BC, Canada
Activity: Spawning
Season: All Seasons

Descriptions

Overview

> Warkentin et al. (2022) used a time series of adult recruitment from the Nicola River to estimate the effects of August low flows in the brood year (x-axis) on returning adult recruits 4 years later (y-axis). The SR function was derived by regressing the annual residuals from the stock-recruit function on August low flows, reasoning that higher than average adult returns are correlated with higher than average flows in the brood year, and lower than average predicted flows (negative residuals) are correlated with lower flows (See figure 4e in Warkentin et al. 2022 for support of this mechanism). Average adult population size was added to the residuals to generate the final y-values (adult population response) for the final SR function, which was then standardized to a maximum of 1 (or 100% capacity; see Rosenfeld and Enright 2025).

Function Derivation

> Observational data (multi-year over time); N = 22

Transferability of Function

> Appropriate for late summer low flow spawning impacts on chinook salmon adults; general transferability to other chinooks stocks in unclear, but likely appropriate for other fall-spawning stocks in the B.C. interior (i.e., regions with similar hydrology to the Nicola R.).
>
> The relationship may be unreliable if extrapolated to a flow range outside the original data (see the Average Salmonid flow-ecology SR function entry based on Rosenfeld and Enright (2025) for a more generalizable function across a wider range of flows).

Source of Stressor Data

> MAD + estimated water usage based off HYDAT hydrometric data and an estimate of annual water usage (unpublished data, Ptolemy; Summit Environmental Consultants Ltd., 2007). See supplement in Warkentin et al. 2022 for further

information.

Stressor was then standardized to % MAD.

Stressor Response Data
