

# Flood Recurrence Interval and Egg-to-Fry Survival

Downloaded on: 2026-02-06, From: <https://mjbayly.com/stressor-response/flood-recurrence-interval-and-egg-fry-survival>  
Function Updated by mbayly on Thu, 11/14/2024 - 00:05.

## Species Information

**Common Name:** Chinook Salmon  
**Genus:** *Oncorhynchus tshawytscha*

## Stressor Details

**Stressor Name:** Peak Flow  
**Units:** Years  
**Metric:** Flood Recurrence Interval  
**Scale:** linear  
**Function Type:** continuous  
**Vital Rate/Process:** Survivorship

## Life Stage & Context

**Life Stages:** Egg, Fry  
**Geography:** Skagit River, Washington

## Descriptions

### Overview

“Effects of peak flows on egg to migrant fry survival have been documented in Chinook salmon in the Skagit River basin (Kinsel et al. 2007), and are presumed to reflect scour of eggs in the gravel due to the overlap in timing of floods and the incubation period. A similar effect is presumed to occur in other river basins. The data from the Skagit River basin are shown in Figure I.9, along with predicted survivals using an exponential regression relationship. Note that the recurrence interval on the x-axis is based on the Skagit River near Mount Vernon, which is low on the mainstem Skagit. In the Chehalis basin, we rescale this relationship to create a multiplier that ranges from 1 at RI = 0 to near zero at RI = 100 (Figure I.10). The equation for the relationship is:

where Multiplier<sub>Pi</sub> is the incubation productivity multiplier and RI is the flood recurrence interval. In each year of the model run, the multiplier is then calculated using this function, based on the flood recurrence interval for that year. We used peak flow at the USGS gage on the Chehalis River at Porter as the index flow. Peak flows, probabilities of occurrence, and recurrence intervals were calculated using the PeakFQ USGS software (<https://water.usgs.gov/software/PeakFQ/>). Results for that gage are shown in Table I.3.” (Beechie et al. 2021, p. 230)

### Function Derivation

empirical data

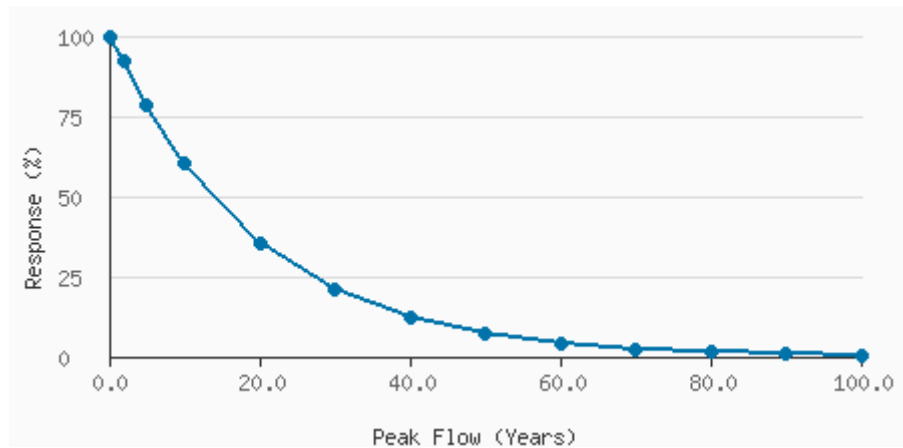

### Transferability of Function

This function was derived from egg-to-migrant survival estimates from annual monitoring in the Skagit River. It could be applied with caution to other Chinook Salmon systems.

### Source of Stressor Data

This function is not currently being used in CEMPRA or in the Beechie NOAA model. Stressor magnitude data could be extracted from USGS hydro gauge data.

## Stressor Response Data

Stressor (X)	Mean System Capacity (%)	SD	low.limit	up.limit
0	100	0	0	100
2	91.91	0	0	100
5	78.4	0	0	100
10	60.15	0	0	100
20	35.4	0	0	100
30	20.84	0	0	100
40	12.27	0	0	100
50	7.22	0	0	100
60	4.25	0	0	100
70	2.5	0	0	100
80	1.47	0	0	100
90	0.87	0	0	100
100	0.51	0	0	100
